Drift of the hindsight constant threshold of each score: the 10 largest locations without Florida and horizons -1 to 3

COVID

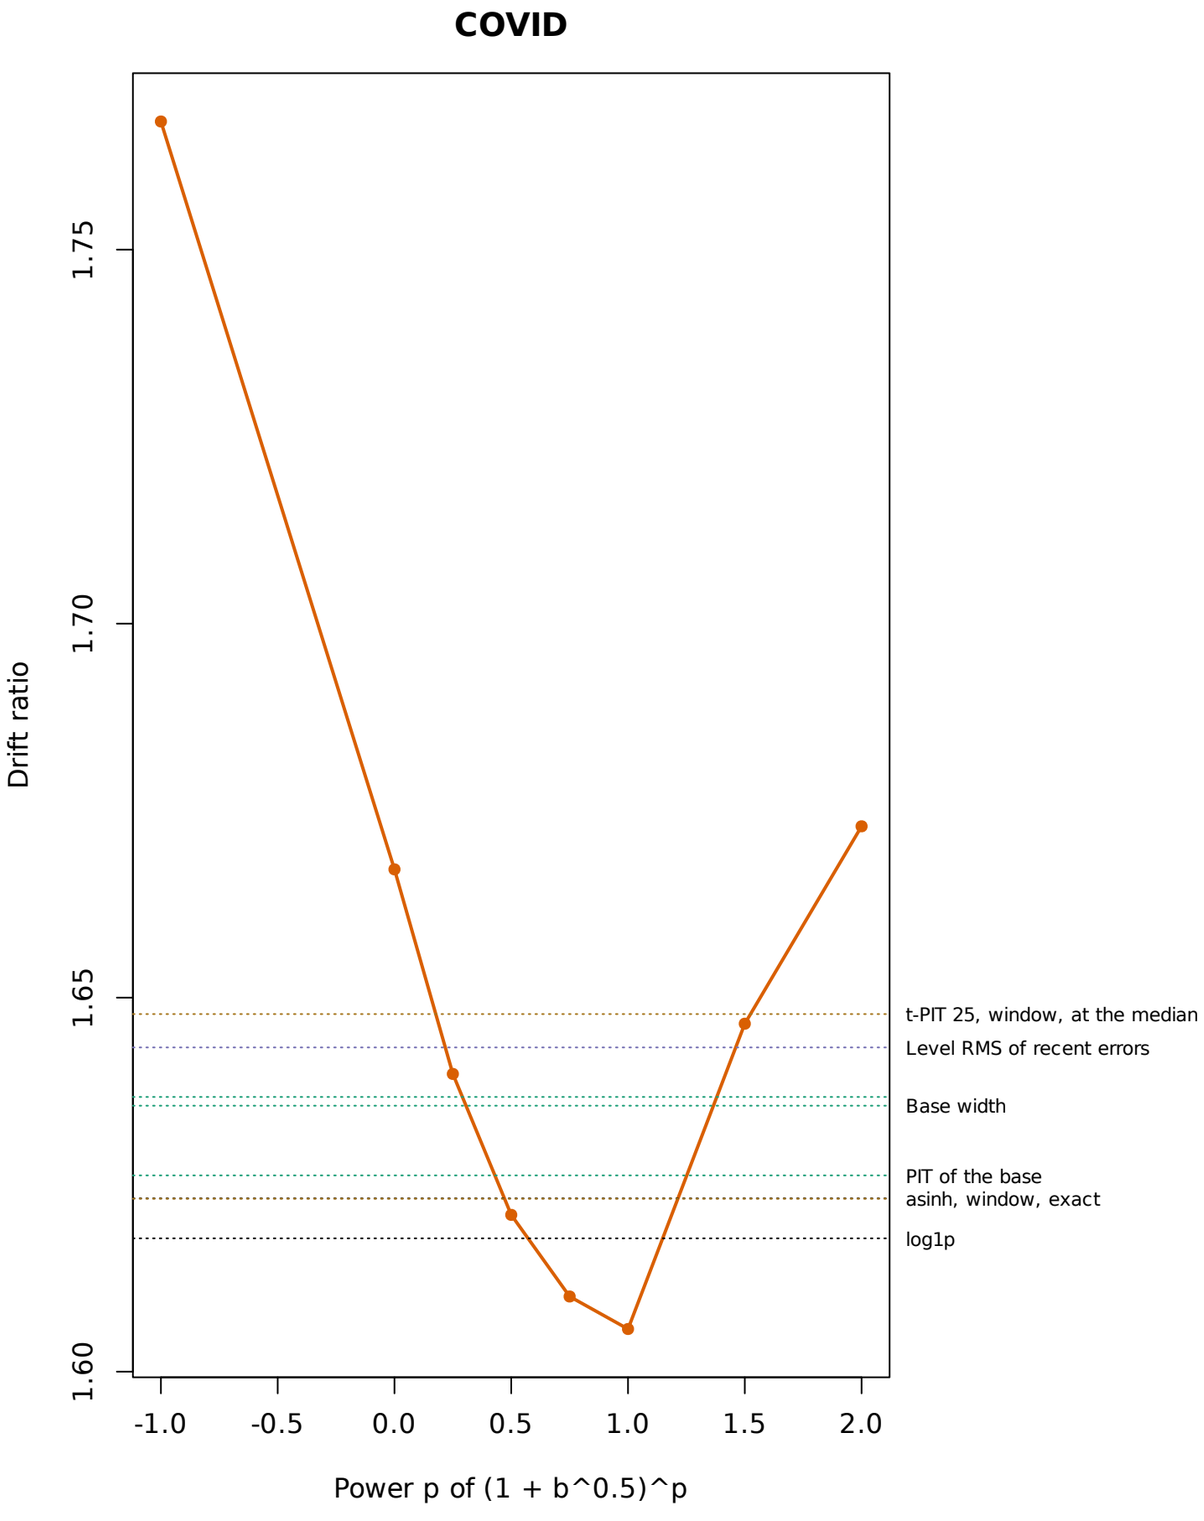

Flu

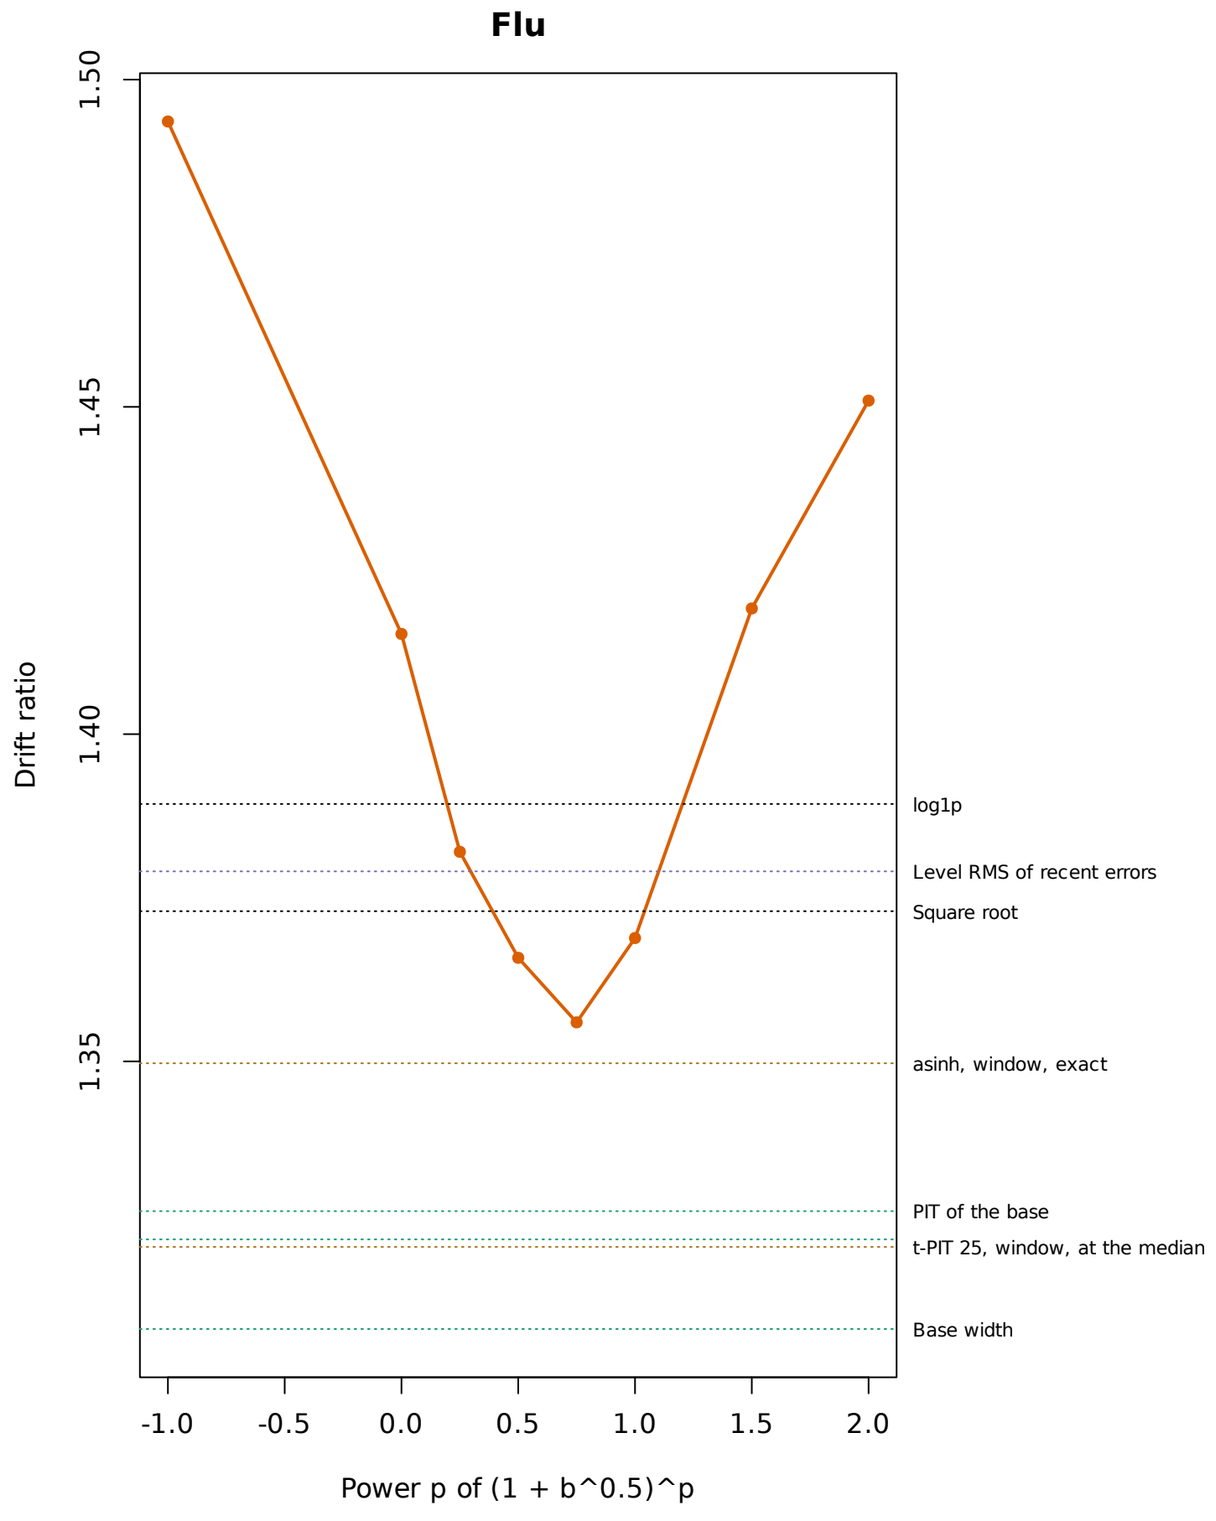

Dot: mean over the cases; bar: their middle half; dashed: the identity score. Every score of a case on the same weeks; own-target revisions only below the longest horizon.

Drift ratio of the scale (1 + b^0.5)^p against p (p = 0: the identity); dotted: other scores

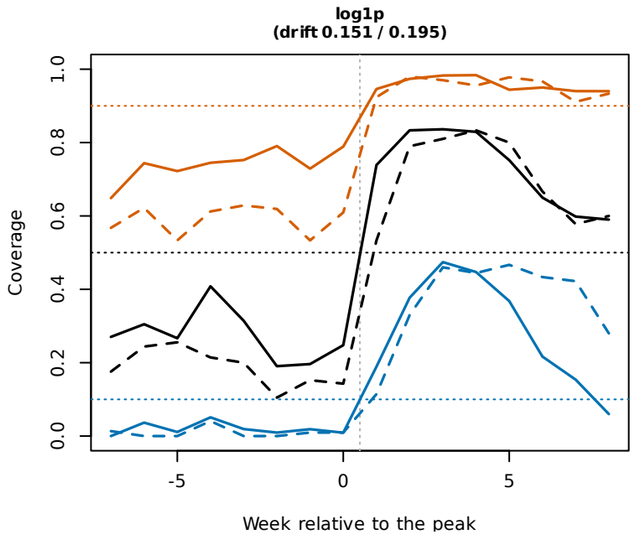

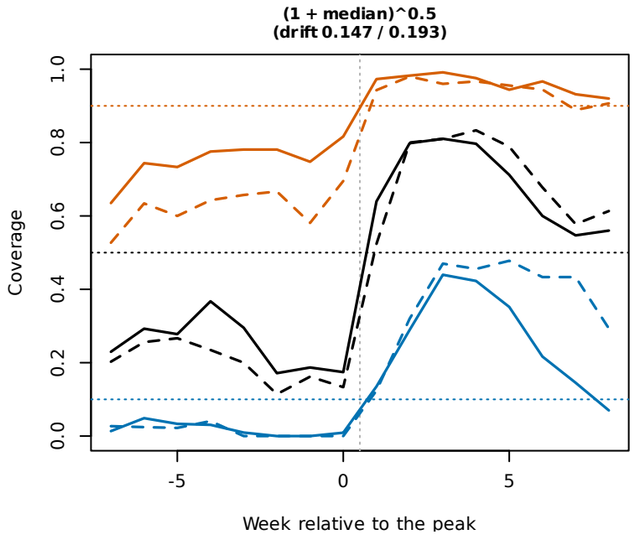

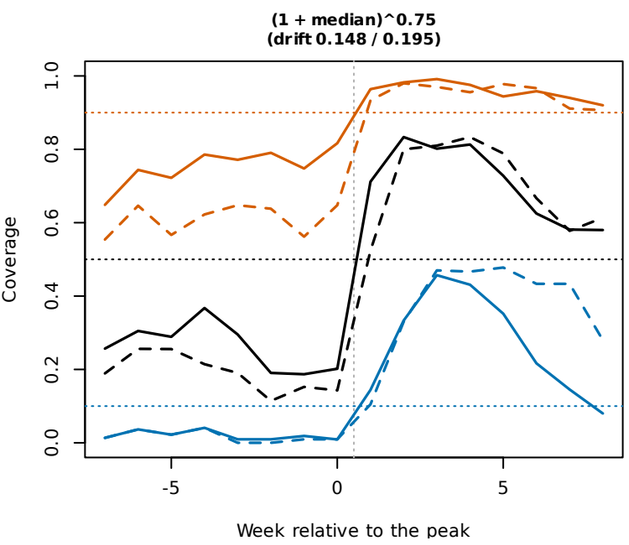

COVID: coverage by week relative to the peak, the 10 largest locations without Florida, horizons -1 to 3

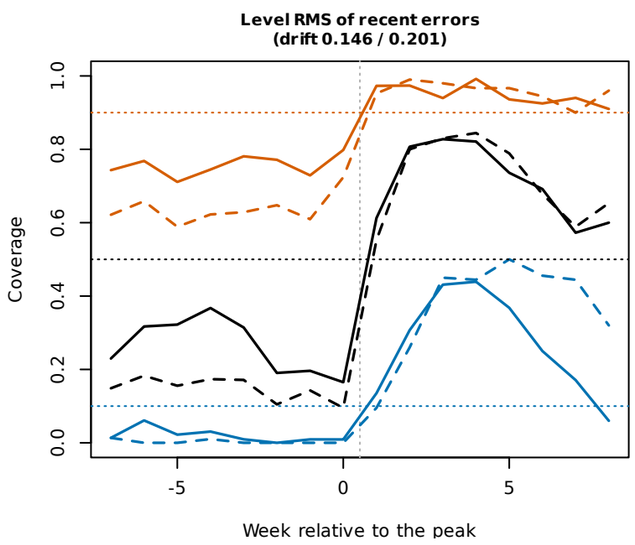

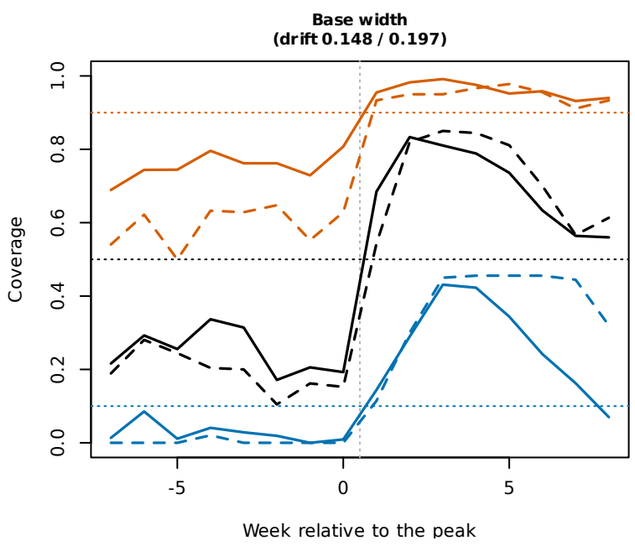

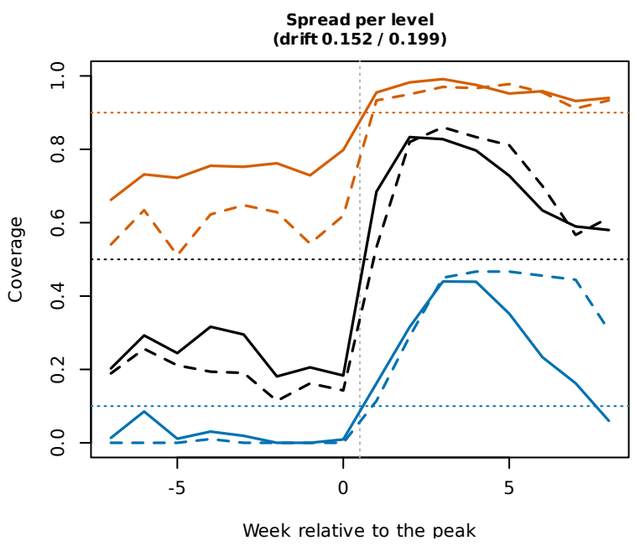

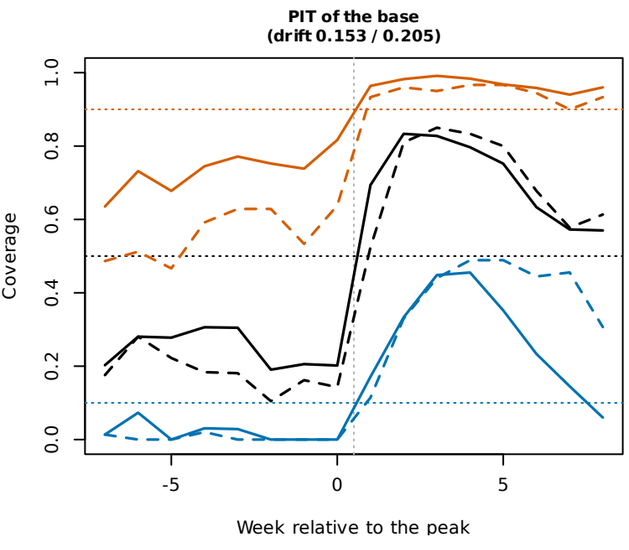

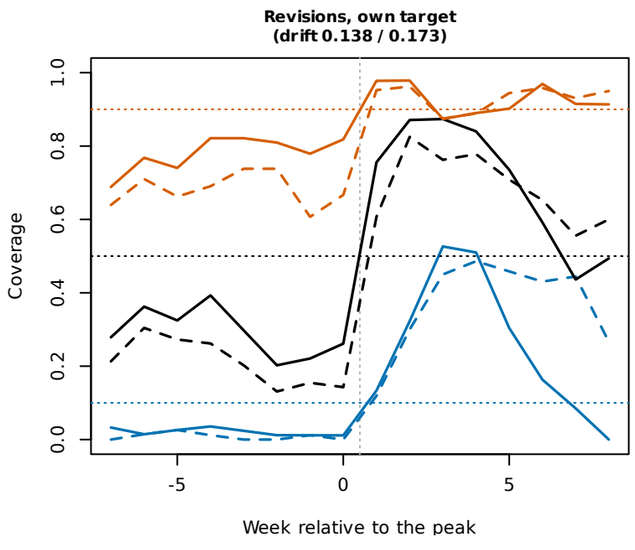

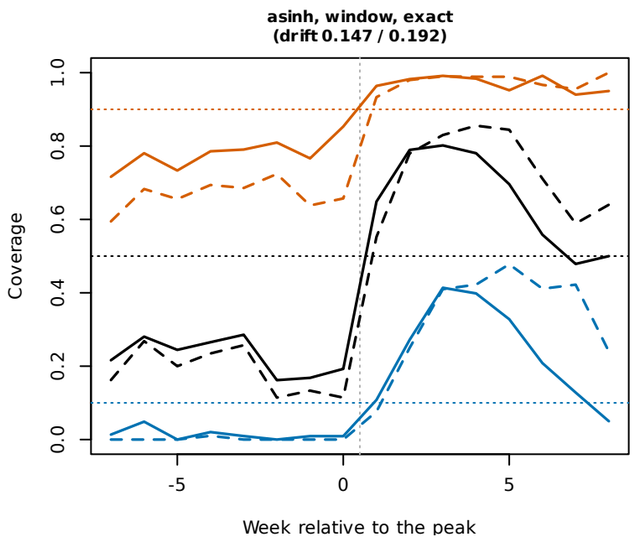

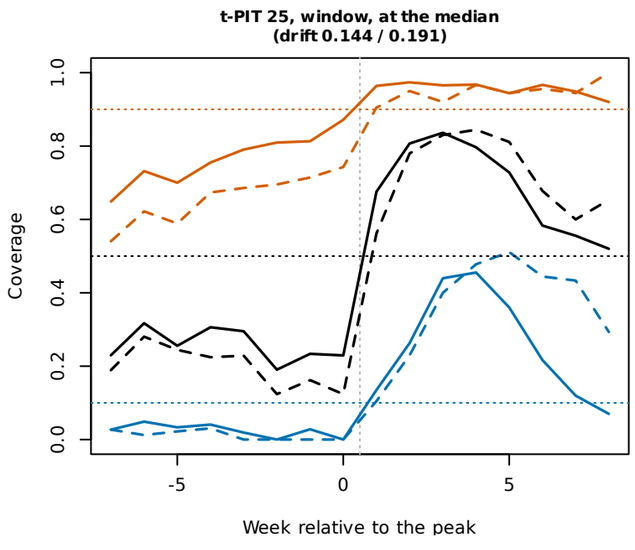

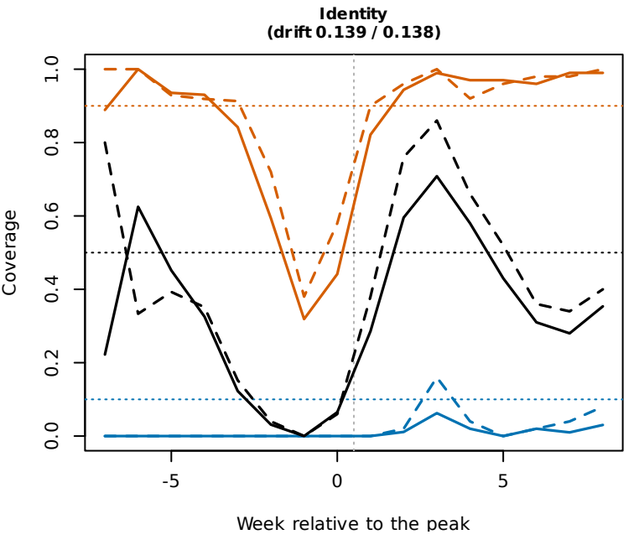

Levels 0.1 (blue), 0.5 (black), 0.9 (red); dotted: the target. Solid: the hindsight constant threshold (all weeks); dashed: the running quantile (evaluation weeks, delay 0).
Drift: mean |coverage - alpha| over the weeks and levels, solid / dashed.

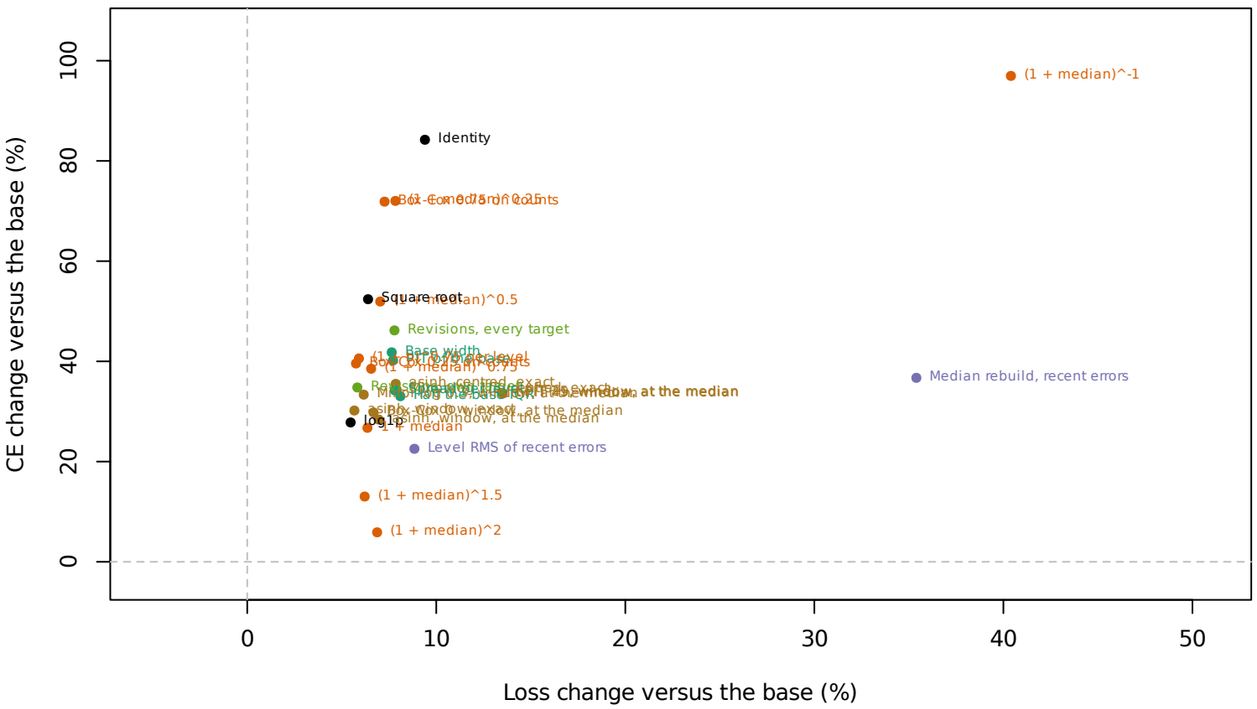

Flu: coverage by week relative to the peak, the 10 largest locations without Florida, horizons -1 to 3

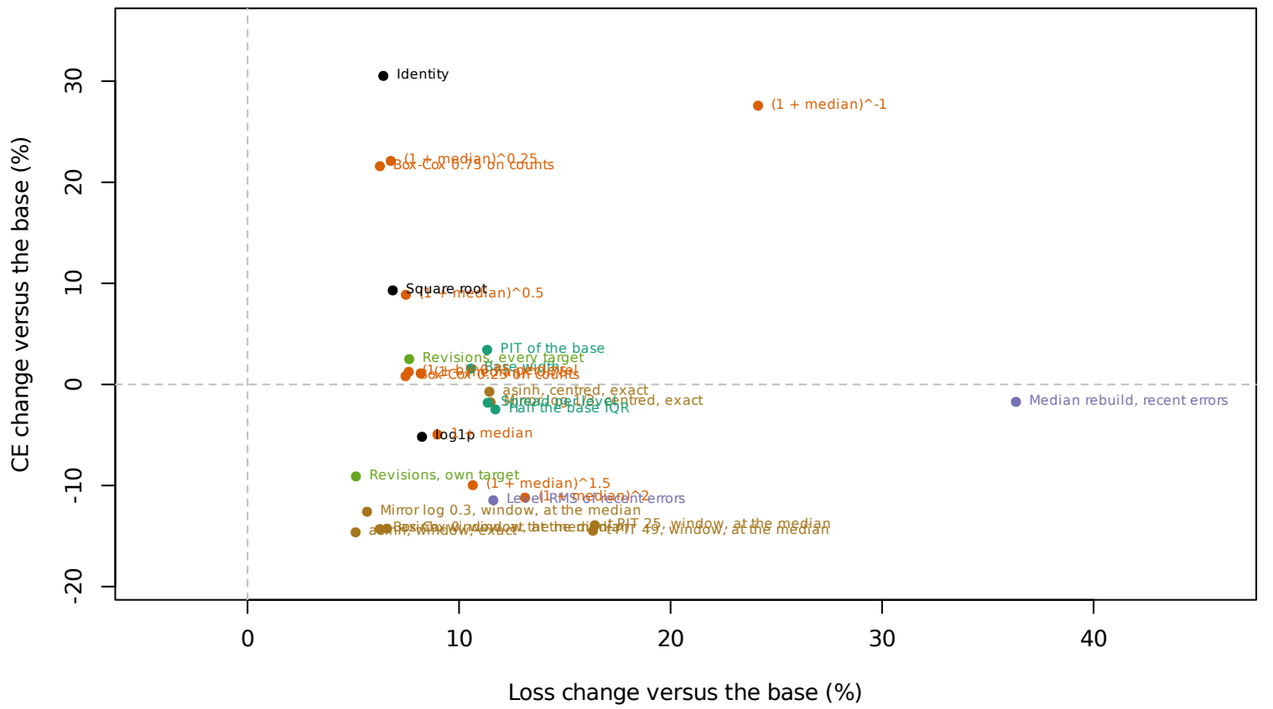

Levels 0.1 (blue), 0.5 (black), 0.9 (red); dotted: the target. Solid: the hindsight constant threshold (all weeks); dashed: the running quantile (evaluation weeks, delay 0).
Drift: mean |coverage - alpha| over the weeks and levels, solid / dashed.

Running quantile of each score's past values, overall: change versus the base, the 10 largest locations without Florida

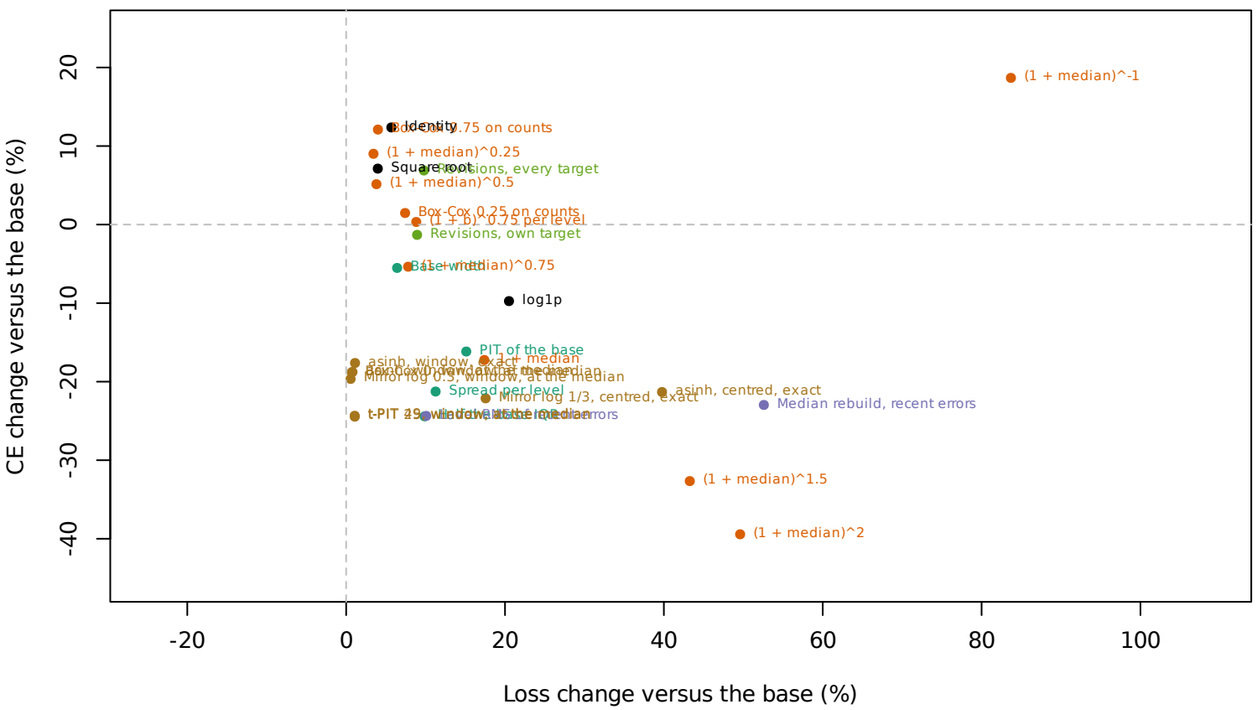

COVID, delay 0

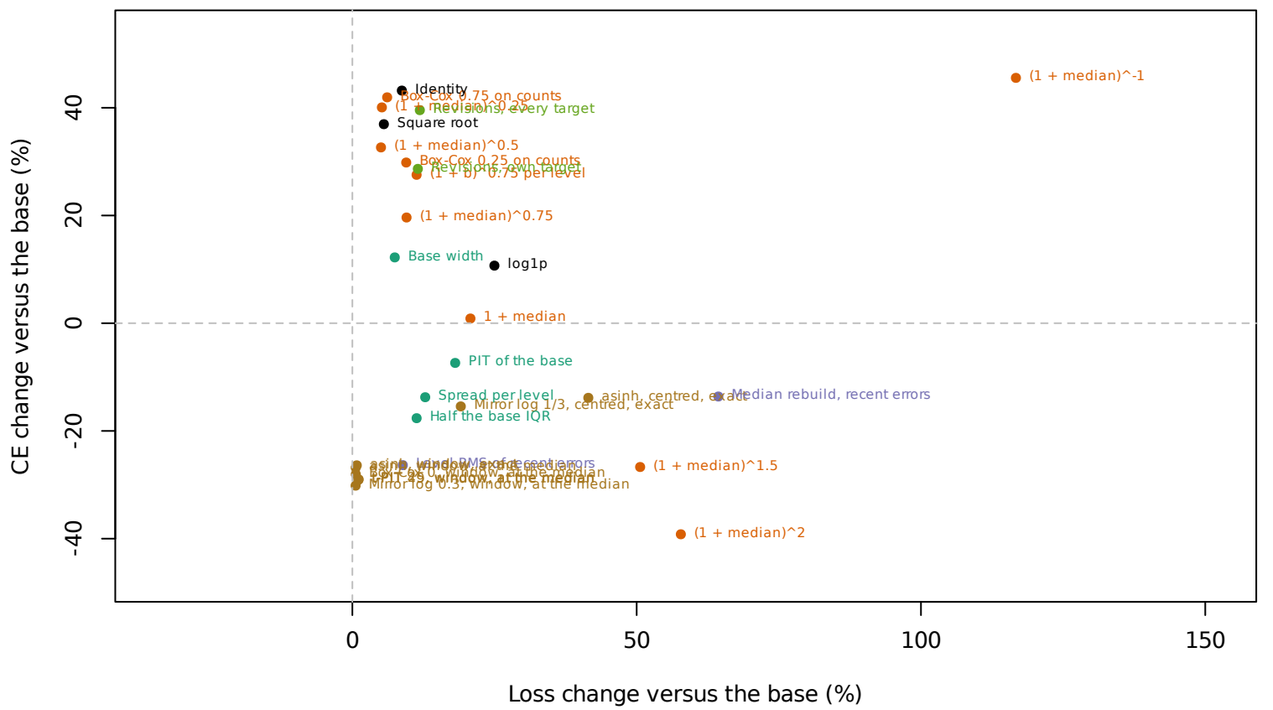

COVID, delay 1

Flu, delay 0

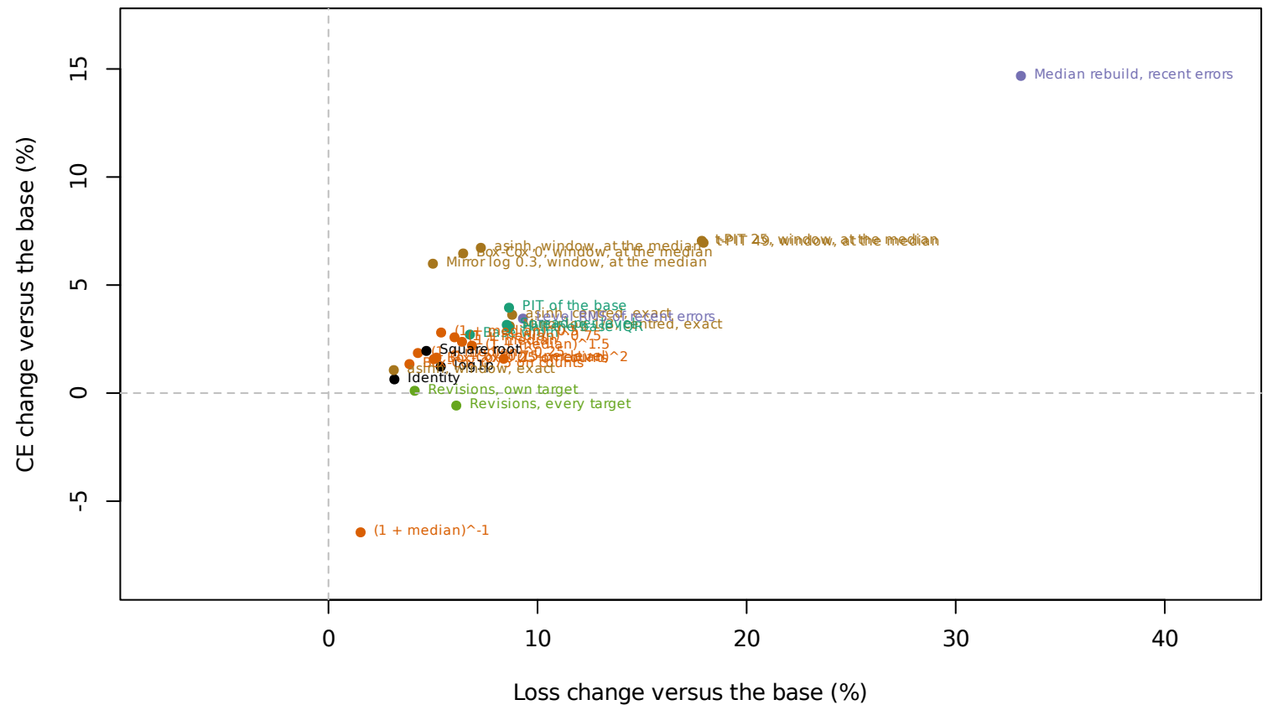

Flu, delay 1

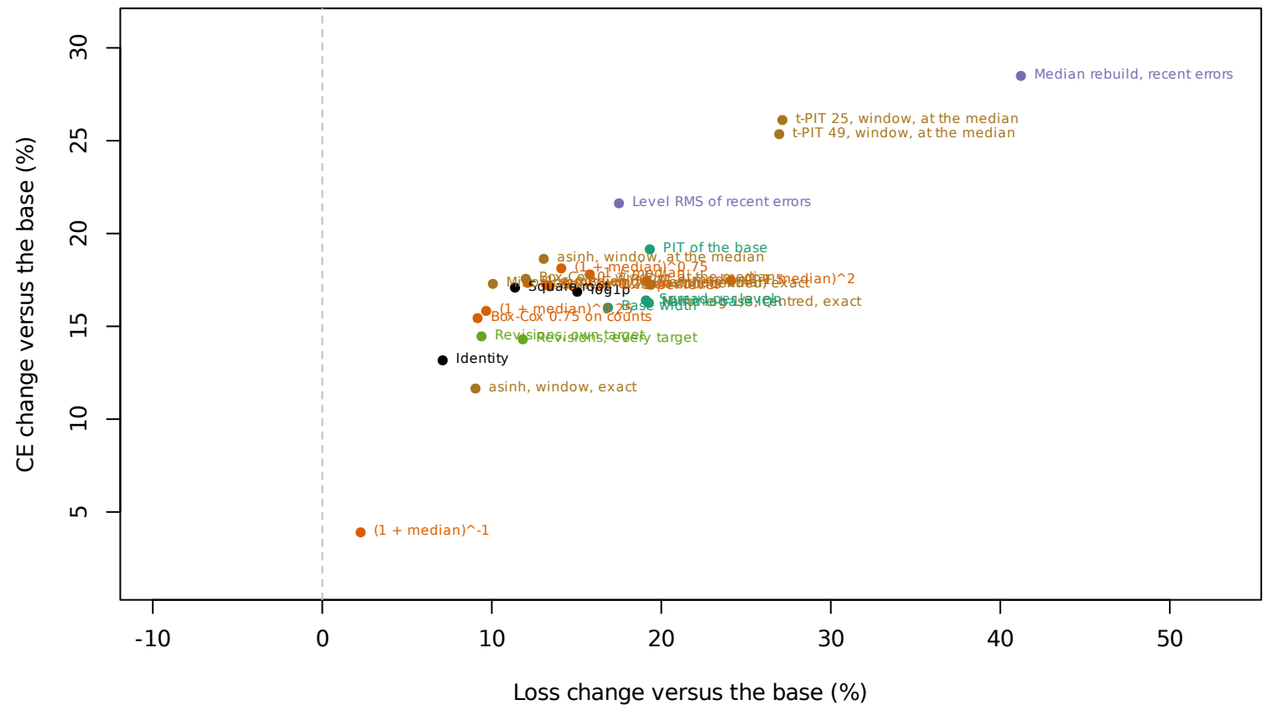

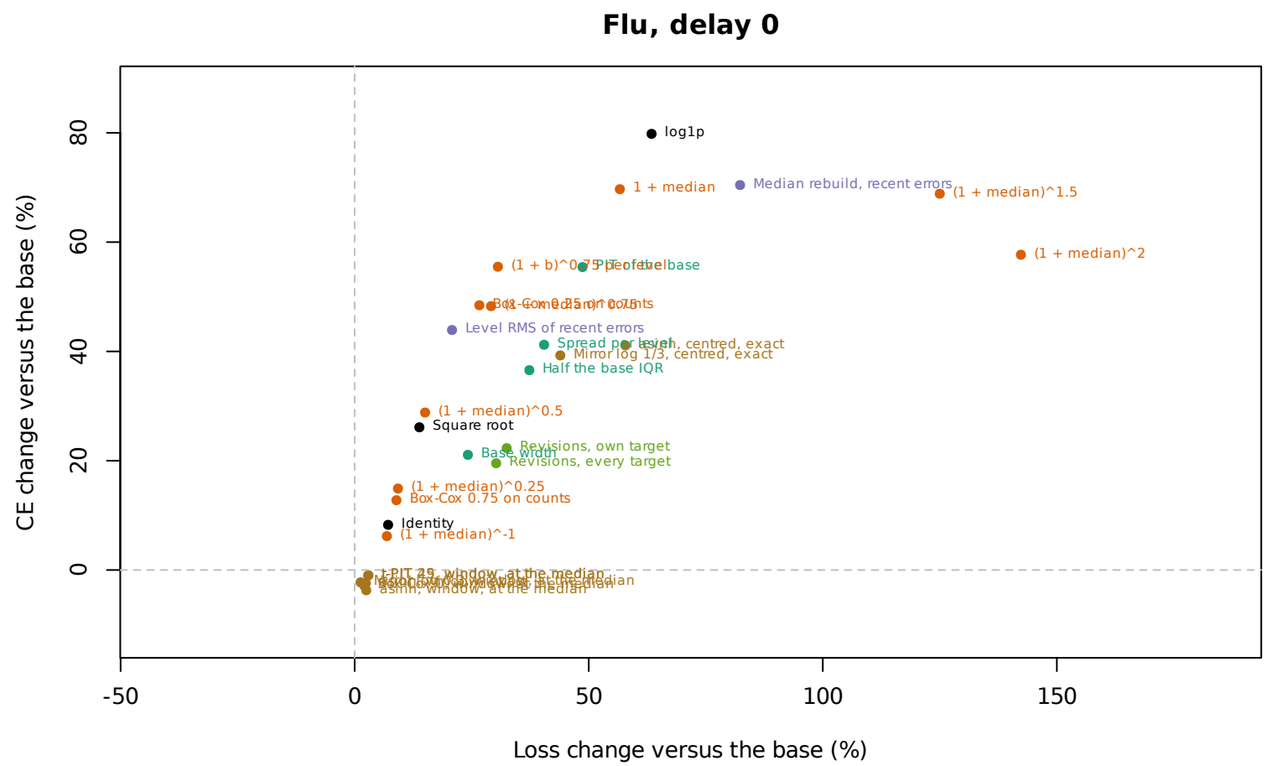

Each week the threshold is the empirical alpha-quantile of all scores reported before the cutoff; no rate. Evaluation weeks. Lower left is better.

D: the score's quantile up to the peak (filled, weeks -7 to 0) and after it (open, weeks 1 to 8), mean over the 10 largest locations without Florida and hori

A threshold that is positive up to the peak and negative after it: the base forecasts too low on the rise and too high in the decline, whatever the scale.
